Protecting network neutrality is one of the most important issues for our modern, increasingly information-centric economy. I have worked as a web developer for the last 15 years and have seen first hand both how profoundly the open Internet has improved our society and the degree to which it has enabled innovators to create new services quickly and efficiently because they have the freedom to act without the permission of network operators and other incumbents.

I have no doubt that without strong, business-protecting regulation by the FCC the same rent-seeking which we've seen in the mobile space will become pervasive and the US high-tech economy will slow as resources which could be funding innovation are diverted away.

To protect the thousands of American businesses which are dependent on the internet there is a very simple rule: anyone providing internet connectivity must provide access to the full internet, without filtering or prioritization except as needed to combat abuse. This allows network operators to charge a fair rate necessary to pay for their expenses but would prohibit the sort of double-charging requested by major ISPs. If the major network operators want the rewards of successful online businesses they are welcome to compete by building innovative, successful services rather than taxing those who actually undertake that challenge.
